COMPUTATIONAL ASPECTS OF OPTIMIZATION

Knapsack problem

Values $a_1 = 4$, $a_2 = 6$, $a_3 = 7$, costs $c_1 = 4$, $c_2 = 5$, $c_3 = 11$, budget $b = 10$:

$$\max \sum_{i=1}^{3} c_i x_i$$

$$\text{s.t.} \sum_{i=1}^{3} a_i x_i \leq 10,$$

$$x_i \in \{0, 1\}.$$

Consider $=$ instead of $\leq$, $0 \leq x_i \leq 1$ and rounding instead of $x_i \in \{0, 1\}$, heuristic (ratio c_i/a_i) ...

Why is integrality so important?

Real (mixed-)integer programming problems (not always linear)

- **Portfolio optimization** – integer number of assets, fixed transaction costs
- **Scheduling** – integer (binary) decision variables to assign a job to a machine
- **Vehicle Routing Problems** (VRP) – binary decision variables which identify a successor of a node on the route
- ...

In general – modelling of **logical relations**, e.g.

- at least two constraints from three are fulfilled,
- if we buy this asset than the fixed transaction costs increase,
- ...

Facility Location Problem

- i warehouses (facilities, branches), j customers,
- x_{ij} – sent (delivered, served) quantity,
- y_i – a warehouse is built,
- c_{ij} – unit supplying costs,
- f_i – fixed costs of building the warehouse,
- K_i – warehouse capacity,
- D_j – demand.

$$\min_{x_{ij}, y_i} \sum_{i=1}^{n} \sum_{j=1}^{m} c_{ij} x_{ij} + \sum_{i} f_i y_i$$

$$\text{s.t.} \sum_{j=1}^{m} x_{ij} \leq K_i y_i, \ i = 1, \ldots, n,$$

$$\sum_{i=1}^{n} x_{ij} = D_j, \ j = 1, \ldots, m,$$

$$x_{ij} \geq 0, \ y_i \in \{0, 1\}.$$

Scheduling to Minimize the Makespan

- i machines, j jobs,
- y – machine makespan,
- x_{ij} – assignment variable,
- t_{ij} – time necessary to process job j on machine i.

$$\min_{x_{ij}, y} y$$
$$\text{s.t. } \sum_{i=1}^{m} x_{ij} = 1, \ j = 1, \ldots, n,$$
$$\sum_{j=1}^{n} t_{ij} x_{ij} \leq y, \ i = 1, \ldots, m, \qquad (1)$$
$$x_{ij} \in \{0, 1\}, \ y \geq 0.$$

Lot Sizing Problem
Uncapacitated single item LSP

- x_t – production at period t,
- y_t – on/off decision at period t,
- s_t – inventory at the end of period t ($s_0 \geq 0$ fixed),
- D_t – (predicted) *expected* demand at period t,
- p_t – unit production costs at period t,
- f_t – setup costs at period t,
- h_t – inventory costs at period t,
- M – a large constant.

$$\min_{x_t, y_t, s_t} \sum_{t=1}^{T} (p_t x_t + f_t y_t + h_t s_t)$$
$$\text{s.t. } s_{t-1} + x_t - D_t = s_t, \ t = 1, \ldots, T, \qquad (2)$$
$$x_t \leq M y_t,$$
$$x_t, s_t \geq 0, \ y_t \in \{0, 1\}.$$

ASS. Wagner-Whitin costs $p_{t+1} \leq p_t + h_t$.

Lot Sizing Problem
Capacitated single item LSP

- x_t – production at period t,
- y_t – on/off decision at period t,
- s_t – inventory at the end of period t ($s_0 \geq 0$ fixed),
- D_t – (predicted) *expected* demand at period t.
- p_t – unit production costs at period t,
- f_t – setup costs at period t,
- h_t – inventory costs at period t,
- C_t – production capacity at period t.

$$\min_{x_t, y_t, s_t} \sum_{t=1}^{T} (p_t x_t + f_t y_t + h_t s_t)$$
$$\text{s.t. } s_{t-1} + x_t - D_t = s_t, \ t = 1, \ldots, T, \qquad (3)$$
$$x_t \leq C_t y_t,$$
$$x_t, s_t \geq 0, \ y_t \in \{0, 1\}.$$

ASS. Wagner-Whitin costs $p_{t+1} \leq p_t + h_t$.

Unit Commitment Problem

- $i = 1, \ldots, n$ units (power plants), $t = 1, \ldots, T$ periods,
- y_{it} – on/off decision for unit i at period t,
- x_{it} – production level for unit i at period t,
- D_t – (predicted) *expected* demand at period t,
- p_i^{min}, p_i^{max} – minimal/maximal production capacity of unit i,
- c_{it} – variable production costs,
- f_{it} – (fixed) start-up costs.

$$\min_{x_{it}, y_{it}} \sum_{i=1}^{n} \sum_{t=1}^{T} (c_{it} x_{it} + f_{it} y_{it})$$
$$\text{s.t. } \sum_{i=1}^{n} x_{it} \geq D_t, \ t = 1, \ldots, T, \qquad (4)$$
$$p_i^{min} y_{it} \leq x_{it} \leq p_i^{max} y_{it},$$
$$x_{it} \geq 0, \ y_{it} \in \{0, 1\}.$$

Integer linear programming

$$\min c^T x \tag{5}$$
$$Ax \geq b, \tag{6}$$
$$x \in \mathbb{Z}_+^n. \tag{7}$$

Assumption: all coefficients are integer (rational before multiplying by a proper constant).

Set of feasible solution and its relaxation

$$S = \{x \in \mathbb{Z}_+^n : Ax \geq b\}, \tag{8}$$
$$P = \{x \in \mathbb{R}_+^n : Ax \geq b\} \tag{9}$$

Obviously $S \subseteq P$. Not so trivial that $S \subseteq \operatorname{conv}(S) \subseteq P$.

ILP – irrational data

Škoda (2010):

$$\max \sqrt{2}x - y$$
$$\text{s.t. } \sqrt{2}x - y \leq 0,$$
$$x \geq 1, \tag{10}$$
$$x, y \in \mathbb{N}.$$

The objective value is bounded (from above), but there is no optimal solution.

For any feasible solution with the objective value $z = \sqrt{2}x^* - \lceil \sqrt{2}x^* \rceil$ we can construct a solution with a higher objective value...

ILP – irrational data

Let $z = \sqrt{2}x^* - \lceil \sqrt{2}x^* \rceil$ be the optimal solution. Since $-1 < z < 0$, we can find $k \in \mathbb{N}$ such that $kz < -1$ and $(k-1)z > -1$. By setting $\epsilon = -1 - kz$ we get that $-1 < z < -\epsilon = 1 + kz < 0$. Then

$$\sqrt{2}kx^* - \lceil \sqrt{2}kx^* \rceil$$
$$= kz + k\lceil \sqrt{2}x^* \rceil - \lceil \sqrt{2}kx^* \rceil$$
$$= -1 - \epsilon + k\lceil \sqrt{2}x^* \rceil - \lceil \sqrt{2}kx^* \rceil \tag{11}$$
$$= k\lceil \sqrt{2}x^* \rceil - 1 - \epsilon - \lceil \lceil \sqrt{2}kx^* \rceil - 1 - \epsilon \rceil$$
$$= -\epsilon > z.$$

($k\lceil \sqrt{2}x^* \rceil - 1$ is integral)
Thus, we have obtained a solution with a higher objective value which is a contradiction.

Example

Consider set S given by

$$7x_1 + 2x_2 \geq 5,$$
$$7x_1 + x_2 \leq 28,$$
$$-4x_1 + 14x_2 \leq 35,$$
$$x_1, x_2 \in \mathbb{Z}_+.$$

Set of feasible solutions, its relaxation and convex envelope
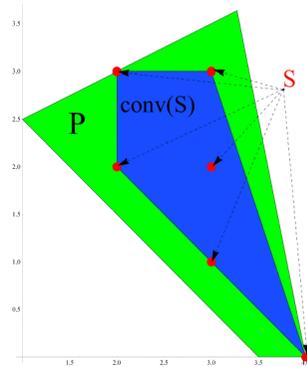

Škoda (2010)

Integer linear programming problem

Problem

$$\min c^T x : \ x \in S. \tag{12}$$

is equivalent to

$$\min c^T x : \ x \in \mathrm{conv}(S). \tag{13}$$

$\mathrm{conv}(S)$ is very difficult to construct – many constraints ("strong cuts") are necessary (there are some important exceptions).

LP-relaxation:

$$\min c^T x : \ x \in P. \tag{14}$$

Mixed-integer linear programming

Often both integer and continuous decision variables appear:

$$\min c^T x + d^T y$$
$$\text{s.t. } Ax + By \geq b$$
$$x \in \mathbb{Z}_+^n, \ y \in \mathbb{R}_+^{n'}.$$

(WE DO NOT CONSIDER IN INTRODUCTION)

Basic algorithms

We consider:
- **Cutting Plane Method**
- **Branch-and-Bound**

There are methods which combine the previous alg., e.g. **Branch-and-Cut** (add cuts to reduce the problem for B&B).

Cutting plane method – Gomory cuts

1. Solve LP-relaxation using (primal or dual) SIMPLEX algorithm.
   - If the solution is integral – END, we have found an optimal solution,
   - otherwise continue with the next step.

2. Add a **Gomory cut** (...) and solve the resulting problem using DUAL SIMPLEX alg.

Example

$$\min 4x_1 + 5x_2 \tag{15}$$
$$x_1 + 4x_2 \geq 5, \tag{16}$$
$$3x_1 + 2x_2 \geq 7, \tag{17}$$
$$x_1, x_2 \in \mathbb{Z}_+^n. \tag{18}$$

Dual simplex for LP-relaxation ...

After two iterations of the dual SIMPLEX algorithm ...

			4	5	0	0
			x_1	x_2	x_3	x_4
5	x_2	8/10	0	1	-3/10	1/10
4	x_1	18/10	1	0	2/10	-4/10
		112/10	0	0	-7/10	-11/10

Gomory cuts

There is a row in simplex table, which corresponds to a **non-integral solution** x_i in the form:

$$x_i + \sum_{j \in N} w_{ij} x_j = d_i, \tag{19}$$

where N denotes the set of non-basic variables; d_i is non-integral. We denote

$$w_{ij} = \lfloor w_{ij} \rfloor + f_{ij}, \tag{20}$$
$$d_i = \lfloor d_i \rfloor + f_i, \tag{21}$$

i.e. $0 \leq f_{ij}, f_i < 1$.

$$\sum_{j \in N} f_{ij} x_j \geq f_i, \tag{22}$$

or rather $-\sum_{j \in N} f_{ij} x_j + s = -f_i$, $s \geq 0$.

Gomory cuts

General properties of cuts (including Gomory ones):

- Property 1: Current (non-integral) solution becomes infeasible (it is cut).
- Property 2: No feasible integral solution becomes infeasible (it is not cut).

Gomory cuts – property 1

We express the constraints in the form

$$x_i + \sum_{j \in N} (\lfloor w_{ij} \rfloor + f_{ij}) x_j \quad = \quad \lfloor d_i \rfloor + f_i, \tag{23}$$

$$x_i + \sum_{j \in N} \lfloor w_{ij} \rfloor x_j - \lfloor d_i \rfloor \quad = \quad f_i - \sum_{j \in N} f_{ij} x_j. \tag{24}$$

Current solution $x_j^* = 0$ pro $j \in N$ a $x_i^* = d_i$ is non-integral, i.e. $0 < x_i^* - \lfloor d_i \rfloor < 1$, thus

$$0 < x_i^* - \lfloor d_i \rfloor = f_i - \sum_{j \in N} f_{ij} x_j^* \tag{25}$$

and

$$\sum_{j \in N} f_{ij} x_j^* < f_i, \tag{26}$$

which is a contradiction with the Gomory cut.

Gomory cuts – property 2

Consider an arbitrary integral feasible solution and rewrite the constraint as

$$x_i + \sum_{j \in N} \lfloor w_{ij} \rfloor x_j - \lfloor d_i \rfloor \quad = \quad f_i - \sum_{j \in N} f_{ij} x_j, \tag{27}$$

Left-hand side (LS) is integral, thus right-hand side (RS) is integral. Moreover, $f_i < 1$ a $\sum_{j \in N} f_{ij} x_j \geq 0$, thus RS is strictly lower than 1 and at the same time it is integral, thus lower or equal to 0, i.e. we obtain Gomory cut

$$f_i - \sum_{j \in N} f_{ij} x_j \leq 0. \tag{28}$$

Thus each integral solution fulfills it.

Cutting plane methods – steps
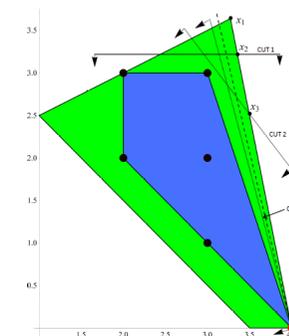

Škoda (2010)

Dantzig cuts

$$\sum_{j \in N} x_j \geq 1. \tag{29}$$

(Remind that non-basic variables are equal to zero.)

After two iterations of the dual SIMPLEX algorithm ...

			4	5	0	0
			x_1	x_2	x_3	x_4
5	x_2	8/10	0	1	-3/10	1/10
4	x_1	18/10	1	0	2/10	-4/10
		112/10	0	0	-7/10	-11/10

For example, x_1 is not integral:

$$
\begin{aligned}
x_1 + 2/10 x_3 - 4/10 x_4 &= 18/10, \\
x_1 + (0 + 2/10) x_3 + (-1 + 6/10) x_4 &= 1 + 8/10.
\end{aligned}
$$

Gomory cut:

$$2/10 x_3 + 6/10 x_4 \geq 8/10.$$

New simplex table

			4	5	0	0	0
			x_1	x_2	x_3	x_4	x_5
5	x_2	8/10	0	1	-3/10	1/10	0
4	x_1	18/10	1	0	2/10	-4/10	0
0	x_5	-8/10	0	0	- 2/10	-6/10	1
		112/10	0	0	-7/10	-11/10	0

Dual simplex alg. ... Gomory cut:

$$4/6 x_3 + 1/6 x_5 \geq 2/3.$$

Dual simplex alg. ... optimal solution $(2, 1, 1, 1, 0, 0)$.
