COMPUTATIONAL ASPECTS OF OPTIMIZATION

Martin Branda (KPMS MFF UK)

2019-05-18 1 / 36

Motivation and applications

Why is integrality so important?

Real (mixed-)integer programming problems (not always linear)

- Portfolio optimization integer number of assets, fixed transaction costs
- Scheduling integer (binary) decision variables to assign a job to a machine
- Vehicle Routing Problems (VRP) binary decision variables which identify a successor of a node on the route
- ...

In general – modelling of logical relations, e.g.

- at least two constraints from three are fulfilled.
- if we buy this asset than the fixed transaction costs increase,
- ...

Motivation and applications

Knapsack problem

Values $a_1 = 4$, $a_2 = 6$, $a_3 = 7$, costs $c_1 = 4$, $c_2 = 5$, $c_3 = 11$, budget b = 10:

$$\max \sum_{i=1}^{3} c_i x_i$$
s.t.
$$\sum_{i=1}^{3} a_i x_i \le 10,$$

$$x_i \in \{0, 1\}.$$

Consider = instead of \leq , $0 \leq x_i \leq 1$ and rounding instead of $x_i \in \{0,1\}$, heuristic (ratio c_i/a_i) ...

Martin Branda (KPMS MFF UK)

2019-05-18 3 / 36

Motivation and applications

Facility Location Problem

- i warehouses (facilities, branches), j customers,
- x_{ij} sent (delivered, served) quantity,
- y_i − a warehouse is built,
- c_{ii} unit supplying costs,
- f_i fixed costs of building the warehouse,
- K_i warehouse capacity,
- D_j demand.

$$\min_{x_{ij},y_i} \sum_{i=1}^{n} \sum_{j=1}^{m} c_{ij}x_{ij} + \sum_{i} f_{i}y_{i}$$
s.t.
$$\sum_{j=1}^{m} x_{ij} \le K_{i}y_{i}, i = 1, \dots, n,$$

$$\sum_{i=1}^{n} x_{ij} = D_{j}, j = 1, \dots, m,$$

$$x_{ij} \ge 0, y_{i} \in \{0, 1\}.$$

Martin Branda (KPMS MFF UK) 2019-05-18 4 / 36 Martin Branda (KPMS MFF UK)

Motivation and applications

Scheduling to Minimize the Makespan

- i machines, j jobs,
- y machine makespan,
- x_{ii} − assignment variable,
- t_{ij} time necessary to process job j on machine i.

$$\min_{x_{ij},y} y$$
s.t.
$$\sum_{i=1}^{m} x_{ij} = 1, \ j = 1, \dots, n,$$

$$\sum_{j=1}^{n} t_{ij} x_{ij} \le y, \ i = 1, \dots, m,$$

$$x_{ij} \in \{0,1\}, \ y > 0.$$

Martin Branda (KPMS MFF UK) 2019-05-18 6 / 36

Motivation and applications

Lot Sizing Problem

Capacitated single item LSP

- x_t production at period t,
- v_t on/off decision at period t,
- s_t inventory at the end of period t ($s_0 > 0$ fixed),
- D_t (predicted) expected demand at period t.
- p_t unit production costs at period t,
- f_t setup costs at period t,
- h_t inventory costs at period t,
- C_t production capacity at period t.

$$\min_{\substack{x_t, y_t, s_t \\ x_t, y_t, s_t}} \sum_{t=1}^{T} (p_t x_t + f_t y_t + h_t s_t)
\text{s.t. } s_{t-1} + x_t - D_t = s_t, \ t = 1, \dots, T,
x_t \le C_t y_t,
x_t, s_t \ge 0, \ y_t \in \{0, 1\}.$$
(3)

ASS. Wagner-Whitin costs $p_{t+1} \leq p_t + h_t$.

Motivation and application

Lot Sizing Problem

Uncapacitated single item LSP

- x_t production at period t,
- y_t on/off decision at period t,
- s_t inventory at the end of period t ($s_0 > 0$ fixed),
- D_t (predicted) expected demand at period t,
- p_t unit production costs at period t,
- f_t setup costs at period t,
- h_t inventory costs at period t,
- M − a large constant.

$$\min_{x_{t}, y_{t}, s_{t}} \sum_{t=1}^{T} (\rho_{t} x_{t} + f_{t} y_{t} + h_{t} s_{t})$$
s.t. $s_{t-1} + x_{t} - D_{t} = s_{t}, t = 1, ..., T,$

$$x_{t} \leq M y_{t},$$

$$x_{t}, s_{t} > 0, y_{t} \in \{0, 1\}.$$
(2)

ASS. Wagner-Whitin costs $p_{t+1} \leq p_t + h_t$.

2019-05-18 7 / 36

Motivation and applicati

Unit Commitment Problem

- i = 1, ..., n units (power plants), t = 1, ..., T periods,
- y_{it} on/off decision for unit i at period t,
- x_{it} production level for unit i at period t,
- D_t (predicted) expected demand at period t,
- p_i^{min} , p_i^{max} minimal/maximal production capacity of unit i,
- cit variable production costs,
- f_{it} (fixed) start-up costs.

$$\min_{x_{it}, y_{it}} \sum_{i=1}^{n} \sum_{t=1}^{T} (c_{it}x_{it} + f_{it}y_{it})$$
s.t.
$$\sum_{i=1}^{n} x_{it} \ge D_t, t = 1, \dots, T,$$

$$\rho_i^{min} y_{it} \le x_{it} \le \rho_i^{max} y_{it},$$

$$x_{it} \ge 0, y_{it} \in \{0, 1\}.$$
(4)

Martin Branda (KPMS MFF UK) 2019-05-18 8 / 36 Martin Branda (KPMS MFF UK) 2019-05-18 9 / 36

Motivation and applications

Sparse l_1 regression

- Y_i dependent variable i = 1, ..., n,
- X_{ij} explanatory (independent) variables $j=1,\ldots,m$,
- β_i coefficients.

$$\min_{\beta_j} \sum_{i=1}^n \left| Y_i - \sum_{j=1}^m X_{ij} \beta_j \right| \tag{5}$$

s.t. at most $\kappa < m$ coefficients are nonzero.

MILP reformulation

$$\min_{\beta, u, z} \sum_{i=1}^{n} u_{i}^{+} + u_{i}^{-}$$
s.t. $u_{i}^{+} - u_{i}^{-} = Y_{i} - \sum_{j=1}^{m} X_{ij}\beta_{j}$,
$$- Mz_{j} \leq \beta_{j} \leq Mz_{j},$$

$$\sum_{j=1}^{m} z_{j} \leq \kappa, \ u_{i}^{+}, u_{i}^{-} \geq 0, \ z_{j} \in \{0, 1\}.$$
(6)

Motivation and applications

Chance constrained problems – single random constraint

Let ξ have a finite discrete distribution with realizations ξ^1,\ldots,ξ^S and probabilities $p_s>0$, $\sum_{s=1}^S p_s=1$:

$$\min_{x,y} f(x) \\
\text{s.t.} \\
\sum_{s=1}^{S} p_s y_s \geq 1 - \varepsilon, \\
g(x, \xi_s) \leq M(1 - y_s), \ s = 1, \dots, S \\
y_s \in \{0, 1\}, \ s = 1, \dots, S, \\
x \in X,$$
(7)

where $M \ge \max_{s=1,...,S} \sup_{x \in X} g(x, \xi_s)$.

Example: Value at Risk (VaR).

Motivation and applications

Chance constrained problems - single random constraint

Let $f,g(\cdot,\xi):\mathbb{R}^n\to\mathbb{R}$ be real functions, $X\subseteq\mathbb{R}^n$, ξ be a real random vector, $\varepsilon\in(0,1)$ small:

$$\min_{x \in X} f(x)$$
s.t.
$$P(g(x, \xi) \le 0) \ge 1 - \varepsilon.$$

INTERPRETATION: for a given $x \in X$, the probability of ξ for which the random constraint is fulfilled must be at least $1 - \varepsilon$:

$$P(g(x,\xi) \le 0) = P(\{\xi : g(x,\xi) \le 0\}).$$

Martin Branda (KPMS MFF UK)

2019-05-18 11 / 36

Formulation and proper

Integer linear programming

$$\min c^T x \tag{8}$$

$$Ax \geq b, (9)$$

$$x \in \mathbb{Z}_+^n. \tag{10}$$

Assumption: all coefficients are integer (rational before multiplying by a proper constant).

Set of feasible solution and its relaxation

$$S = \{x \in \mathbb{Z}_+^n : Ax \ge b\},\tag{11}$$

$$P = \{x \in \mathbb{R}^n_+ : Ax \ge b\} \tag{12}$$

Obviously $S \subseteq P$. Not so trivial that $S \subseteq conv(S) \subseteq P$.

Martin Branda (KPMS MFF UK) 2019-05-18 12 / 36 Martin Branda (KPMS MFF UK)

Formulation and properties

ILP – irrational data

Škoda (2010):

$$\max \sqrt{2}x - y$$
s.t. $\sqrt{2}x - y \le 0$,
$$x \ge 1$$
,
$$x, y \in \mathbb{N}.$$
(13)

The objective value is bounded (from above), but there is no optimal solution

For any feasible solution with the objective value $z=\sqrt{2}x^*-\left\lceil\sqrt{2}x^*\right\rceil$ we can construct a solution with a higher objective value...

Martin Branda (KPMS MFF UK)

2019-05-18 15 / 36

2019-05-18 17 / 36

Formulation and properties

Example

Consider set S given by

Martin Branda (KPMS MFF UK)

$$7x_1 + 2x_2 \ge 5,$$

$$7x_1 + x_2 \le 28,$$

$$-4x_1 + 14x_2 \le 35,$$

$$x_1, x_2 \in \mathbb{Z}_+.$$

Formulation and properties

ILP – irrational data

Let $z=\sqrt{2}x^*-\left\lceil\sqrt{2}x^*\right\rceil$ be the optimal solution. Since -1 < z < 0, we can find $k \in \mathbb{N}$ such that kz < -1 and (k-1)z > -1. By setting $\epsilon = -1 - kz$ we get that $-1 < z < -\epsilon = 1 + kz < 0$. Then

$$\sqrt{2}kx^* - \left\lceil \sqrt{2}kx^* \right\rceil
= kz + k \left\lceil \sqrt{2}x^* \right\rceil - \left\lceil \sqrt{2}kx^* \right\rceil
= -1 - \epsilon + k \left\lceil \sqrt{2}x^* \right\rceil - \left\lceil \sqrt{2}kx^* \right\rceil
= k \left\lceil \sqrt{2}x^* \right\rceil - 1 - \epsilon - \left\lceil \left\lceil \sqrt{2}kx^* \right\rceil - 1 - \epsilon \right\rceil
= -\epsilon > z.$$
(14)

$$(k \lceil \sqrt{2}x^* \rceil - 1 \text{ is integral})$$

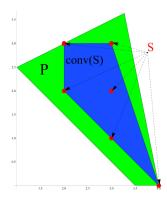

Thus, we have obtained a solution with a higher objective value which is a contradiction.

Martin Branda (KPMS MFF UK)

2019-05-18 16 / 36

Formulation and proper

Set of feasible solutions, its relaxation and convex envelope

Škoda (2010)

Martin Branda (KPMS MFF UK) 2019-05-18 18 / 36

Formulation and properties

Integer linear programming problem

Problem

$$\min c^T x : x \in S. \tag{15}$$

is equivalent to

$$\min c^T x : x \in \text{conv}(S). \tag{16}$$

 $\operatorname{conv}(S)$ is very difficult to construct – many constraints ("strong cuts") are necessary (there are some important exceptions).

LP-relaxation:

$$\min c^T x : x \in P. \tag{17}$$

Martin Branda (KPMS MFF UK)

2019-05-18 19 / 36

Formulation and properties

Basic algorithms

We consider:

- Cutting Plane Method
- Branch-and-Bound

There are methods which combine the previous alg., e.g. **Branch-and-Cut** (add cuts to reduce the problem for B&B). Formulation and properties

Mixed-integer linear programming

Often both integer and continuous decision variables appear:

min
$$c^T x + d^T y$$

s.t. $Ax + By \ge b$
 $x \in \mathbb{Z}_+^n, \ y \in \mathbb{R}_+^{n'}$

(WE DO NOT CONSIDER IN INTRODUCTION)

Martin Branda (KPMS MFF UK)

2019-05-18 20 / 36

Cutting plane meth

Cutting plane method – Gomory cuts

- 1. Solve LP-relaxation using (primal or dual) SIMPLEX algorithm.
 - If the solution is integral END, we have found an optimal solution,
 - otherwise continue with the next step.
- Add a Gomory cut (...) and solve the resulting problem using DUAL SIMPLEX alg.

Martin Branda (KPMS MFF UK) 2019-05-18 21 / 36 Martin Branda (KPMS MFF UK) 2019-05-18 23 / 36

Example

$$\min 4x_1 + 5x_2 \tag{18}$$

$$x_1 + 4x_2 \geq 5,$$
 (19)

$$3x_1 + 2x_2 \ge 7, (20)$$

$$x_1, x_2 \in \mathbb{Z}_+^n. \tag{21}$$

Cutting plane metho

Martin Branda (KPMS MFF UK) 2019-05-18 25 / 36

Cutting plane method

Gomory cuts

There is a row in simplex table, which corresponds to a **non-integral** solution x_i in the form:

$$x_i + \sum_{j \in N} w_{ij} x_j = d_i, \tag{22}$$

where \emph{N} denotes the set of non-basic variables; $\emph{d}_\emph{i}$ is non-integral. We denote

$$w_{ij} = \lfloor w_{ij} \rfloor + f_{ij}, \tag{23}$$

$$d_i = \lfloor d_i \rfloor + f_i, \tag{24}$$

i.e. $0 \le f_{ij}, f_i < 1$.

$$\sum_{i \in N} f_{ij} x_j \ge f_i,\tag{25}$$

or rather $-\sum_{j\in N} f_{ij}x_j + s = -f_i, \ s \ge 0.$

Martin Branda (KPMS MFF UK) 2019-05-18 27 / 36

Gomory cuts

General properties of cuts (including Gomory ones):

- Property 1: Current (non-integral) solution becomes infeasible (it is cut).
- Property 2: No feasible integral solution becomes infeasible (it is not cut).

Martin Branda (KPMS MFF UK)

2019-05-18 28 / 36

Cutting plane method

Gomory cuts – property 2

Consider an arbitrary integral feasible solution and rewrite the constraint as

$$x_i + \sum_{j \in N} \lfloor w_{ij} \rfloor x_j - \lfloor d_i \rfloor = f_i - \sum_{j \in N} f_{ij} x_j,$$
 (30)

Left-hand side (LS) is integral, thus right-hand side (RS) is integral. Moreover, $f_i < 1$ a $\sum_{j \in \mathcal{N}} f_{ij} x_j \geq 0$, thus RS is strictly lower than 1 and at the same time it is integral, thus lower or equal to 0, i.e. we obtain Gomory cut

$$f_i - \sum_{i \in N} f_{ij} x_j \le 0. \tag{31}$$

Thus each integral solution fulfills it.

Cutting plane method

Gomory cuts – property 1

We express the constraints in the form

$$x_i + \sum_{j \in N} (\lfloor w_{ij} \rfloor + f_{ij}) x_j = \lfloor d_i \rfloor + f_i,$$
 (26)

$$x_i + \sum_{j \in N} \lfloor w_{ij} \rfloor x_j - \lfloor d_i \rfloor = f_i - \sum_{j \in N} f_{ij} x_j.$$
 (27)

Current solution $x_j^*=0$ for $j\in N$ and $x_i^*=d_i$ is non-integral, i.e. $0< x_i^*-\lfloor d_i\rfloor<1$, thus

$$0 < x_i^* - \lfloor d_i \rfloor = f_i - \sum_{j \in N} f_{ij} x_j^*$$
 (28)

and

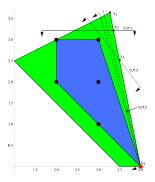

$$\sum_{i \in N} f_{ij} x_j^* < f_i, \tag{29}$$

which is a contradiction with the Gomory cut.

Martin Branda (KPMS MFF UK) 2019-05-18 29 / 36

Cutting plane meth

Cutting plane methods - steps

Škoda (2010)

Martin Branda (KPMS MFF UK) 2019-05-18 31 / 36

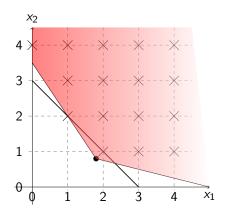

Dantzig cuts

$$\sum_{j\in\mathcal{N}} x_j \ge 1. \tag{32}$$

(Remind that non-basic variables are equal to zero.)

Martin Branda (KPMS MFF UK) 2019-05-18 32 / 36

Cutting plane method

Cutting plane metho

After two iterations of the dual SIMPLEX algorithm ...

			4	5	0	0
			<i>x</i> ₁	<i>x</i> ₂	<i>X</i> 3	X4
5	<i>X</i> ₂	8/10	0	1	-3/10	1/10
4	<i>x</i> ₁	18/10	1	0	2/10	-4/10
		112/10	0	0	-7/10	-11/10

For example, x_1 is not integral:

$$x_1 + 2/10x_3 - 4/10x_4 = 18/10,$$

 $x_1 + (0 + 2/10)x_3 + (-1 + 6/10)x_4 = 1 + 8/10.$

Gomory cut:

$$2/10x_3 + 6/10x_4 \ge 8/10$$
.
