Totally unimodular matrices

Totally unimodular matrices

Definition

A matrix A is totally unimodular (TU) iff every square submatrix of A has determinant +1, -1, or 0.

The linear program has an integral optimal solution for all integer r.h.s. b if and only if A is TU.

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Totally unimodular matrices

A set of sufficient conditions:

- $a_{ij} \in \{-1,0,1\}$ for all i,j
- Each column contains at most two nonzero coefficients, i.e. $\sum_{i=1}^{m} |a_{ij}| \leq 2$,
- There exists a partitioning $M_1 \cap M_2 = \emptyset$ of the rows $1, \ldots, m$ such that each column j containing two nonzero coefficients satisfies

$$\sum_{i\in M_1}a_{ij}=\sum_{i\in M_2}a_{ij}.$$

If A is TU, then A^T and (A|I) are TU.

Minimum cost network flow problem

- G = (V, A) graph with vertices V and (oriented) arcs A
- h_{ij} arc capacity
- c_{ij} flow cost

•
$$b_i$$
 – demand, ASS. $\sum_i b_i = 0$

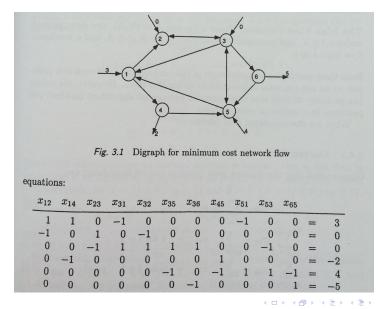

•
$$V^+(i) = \{k : (i,k) \in A\}$$
 – successors of i

•
$$V^{-}(i) = \{k : (k, i) \in A\}$$
 – predecessors of i

$$\begin{split} \min_{x_{ij}} & \sum_{(i,j)\in A} c_{ij} x_{ij} \\ \text{s.t.} & \sum_{k\in V^+(i)} x_{ik} - \sum_{k\in V^-(i)} x_{ki} = b_i, \ i\in V, \\ & 0 \leq x_{ij} \leq h_{ij}, \ (i,j) \in A. \end{split}$$

イロト イポト イヨト イヨト 二日

Wolsey (1998), Ex. 3.1 ($M_1 = \{1, \ldots, m\}, M_2 = \emptyset$)

Special cases

- The shortest path problem
- The transportation problem

< ロ > < 同 > < 回 > <

Traveling salesman problem

- *n* town and in one of them there is a traveling salesman.
- Traveling salesman must visit all towns and return back.
- For each pair of towns he/she knows the traveling costs and he is looking for the cheapest route.
- = Finding a Hamilton cycle in a graph with edge prices.

(日) (同) (三) (三)

Assignment problem

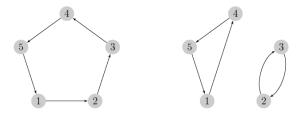

$$\min \sum_{i=1}^{n} \sum_{j=1}^{n} c_{ij} x_{ij}$$
(1)
$$\sum_{i=1}^{n} x_{ij} = 1, j = 1, \dots, n,$$
(2)
$$\sum_{j=1}^{n} x_{ij} = 1, i = 1, \dots, n,$$
(3)
$$x_{ij} \in \{0, 1\}.$$
(4)

We minimize the traveling costs, we arrive to j from exactly one i, we leave i to exactly one j.

<ロト <部ト <きト <きト

Traveling salesman problem

Example – 5 towns – cycle and subcycles (subroute)

Kafka (2013)

Martin Branda (KPMS MFF UK)

Image: A mathematical states and a mathem

Traveling salesman problem

Subroute elimination conditions I

- $x_{ii} = 0$, $c_{ii} = \infty$
- $x_{ij} + x_{ji} \leq 1$
- $x_{ij} + x_{jk} + x_{ki} \leq 2$
- . . .
- $\sum_{i \in S} \sum_{j \in S} x_{ij} \le |S| 1$, $S \subseteq \{1, \dots, n\}$, $2 \le |S| \le n 1$

Approximately 2^n inequalities, it is possible to reduce to $|S| \leq \lceil n/2 \rceil$.

・ロト ・同ト ・ヨト ・ヨー うのつ

Subroute elimination conditions II

$$u_i - u_j + nx_{ij} \le n - 1, i, j = 2, \ldots, n$$

Eliminate subroutes: There is at least one route which does not go through vertex 1, denote this route by *C* and the number of edges by |E(C)|. If we sum these inequalities over all edges $\{i, j\}$, which are in *C*, i.e. the corresponding variables $x_{ij} = 1$, we obtain

$$|E(C)| \le (n-1)|E(C)|,$$
 (5)

which is a contradiction.

Subroute elimination conditions III

$$u_i - u_j + nx_{ij} \leq n - 1, i, j = 2, \ldots, n$$

Hamilton cycle is feasible: let the vertices be ordered as $v_1 = 1, v_2, ..., v_n$. We set $u_i = l$, if $v_l = i$, i.e. u_i represent the order. For each edge of the cycle $\{i, j\}$ it holds $u_i - u_j = -1$, i.e.

$$u_i - u_j + nx_{ij} = -1 + n \le n - 1.$$
 (6)

For edges, which are not in the cycle, the inequality holds too: $u_i - u_j \le n - 1$ a $x_{ij} = 0$.

Traveling salesman problem

Traveling Salesman Problem with Time Windows

- t_i time when customer i is visited
- T_{ij} time necessary to reach j from i
- I_i , u_i lower and upper bound (time window) for visiting customer i
- *M* large constant

$$\min_{x_{ij}, t_{i}} \sum_{i=1}^{n} \sum_{j=1}^{n} c_{ij} x_{ij}$$
(7)
$$\sum_{i=1}^{n} x_{ij} = 1, j = 1, ..., n,$$
(8)
$$\sum_{j=1}^{n} x_{ij} = 1, i = 1, ..., n,$$
(9)
$$t_{i} + T_{ij} - t_{j} \leq M(1 - x_{ij}) i, j = 1, ..., n,$$
(10)
$$l_{i} \leq t_{i} \leq u_{i}, i = 1, ..., n,$$
(11)
$$x_{ii} \in \{0, 1\}.$$

イロト 不得 トイヨト イヨト 二日

Capacitated Vehicle Routing Problem

Parameters

- *n* number of customers
- 0 depo (starting and finishing point of each vehicle)
- *K* number of vehicles (homogeneous)
- $d_j \ge 0$ customer demand, for depo $d_0 = 0$
- Q>0 vehicle capacity ($\mathit{KQ} \geq \sum_{j=1}^n d_j$)
- c_{ij} transportation costs from *i* to *j* (usually $c_{ii} = 0$)

Decision variables

- x_{ij} equal to 1, if j follows after i on the route, 0 otherwise
- u_j upper bound on transported amount after visiting customer j

Traveling salesman problem

Capacitated Vehicle Routing Problem

$$\min_{x_{ij},u_i} \sum_{i=0}^{n} \sum_{j=0}^{n} c_{ij} x_{ij}$$
(12)

$$\sum_{i=0}^{n} x_{ij} = 1, j = 1, \dots, n,$$
(13)

$$\sum_{j=0}^{n} x_{ij} = 1, \ i = 1, \dots, n,$$
(14)

$$\sum_{i=1}^{n} x_{i0} = K,$$
(15)

$$\sum_{j=1}^{n} x_{0j} = K, \qquad (16)$$

$$u_i - u_j + d_j \leq Q(1 - x_{ij}) \ i, j = 1, \dots, n,$$
 (17)

$$d_i \leq u_i \leq Q, \ i = 1, \dots, n, \tag{18}$$

 $x_{ij} \quad \in \quad \{0,1\}.$

Capacitated Vehicle Routing Problem

- (12) minimization of transportation costs
- (13) exactly one vehicle arrives to customer j
- (14) exactly one vehicle leaves customer i
- (15) exactly K vehicles return to depot 0
- (16) exactly K vehicles leave depot 0
- (17) balance conditions of transported amount (subroute elimination conditions)
- (18) bounds on the vehicle capacity

(All vehicles are employed.)

Basic heuristics for VRP

Insertion heuristic:

- Start with empty routes.
- FOR all customers DO: Insert the customer to the place in a route where it causes the lowest increase of the traveled distance.

Clustering:

- Cluster the customers according to their geographic positions ("angles").
- Solve¹ the traveling salesman problem in each cluster.

Possible difficulties: time windows, vehicle capacities, ...

¹..exactly, if the clusters are not large.

Tabu search for VRP

For a given number of iteration, run the following steps:

- Find the best solution in a *neighborhood* of the current solution. Such solution can be worse than the current one or even infeasible (use penalty function).
- Forbid moving back for a random number of steps by actualizing the **tabu list**.
- Remember the best solution.

The tabu search algorithm enables moving from local solutions (compared with a simple "hill climbing alg.").

Norway ...

Rich Vehicle Routing Problems

 Goal – maximization of the ship *filling rate* (operational planning), optimization of fleet composition, i.e. number and capacity of the ships (strategic planning)

• Rich Vehicle Routing Problem

- time windows
- heterogeneous fleet (vehicles with different capacities and speed)
- several depots with inter-depot trips
- several routes during the planning horizon
- non-Euclidean distances (fjords)
- Mixed-integer programming :-(, constructive heuristics for getting an initial feasible solution and tabu search
- M. Branda, K. Haugen, J. Novotný, A. Olstad, Downstream logistics optimization at EWOS Norway. Research report.

イロト 不得 とうせい かほとう ほ

Rich Vehicle Routing Problems

Our approach

- Mathematical formulation
- GAMS implementation
- Heuristic (insertion, tabu search) implementation
- Decision Support System (DSS)

▲ □ ▶ ▲ □ ▶ ▲

Facility Location Problem

- *i* warehouses (facilities), *j* customers
- x_{ij} sent quantity
- y_i a warehouse is built
- c_{ij} unit supplying costs
- *f_i* fixed costs
- *K_i* warehouse capacity
- D_j demand

$$\begin{split} \min_{X_{ij}, Y_i} & \sum_{i=1}^{n} \sum_{j=1}^{m} c_{ij} x_{ij} + \sum_{i} f_i y_i \\ \text{s.t.} & \sum_{j=1}^{m} x_{ij} \leq \mathcal{K}_i y_i, \ i = 1, \dots, n, \\ & \sum_{i=1}^{n} x_{ij} = D_j, \ j = 1, \dots, m, \\ & x_{ij} \geq 0, \ y_i \in \{0, 1\}. \end{split}$$

Scheduling to Minimize the Makespan

- *i* machines, *j* jobs,
- y machine makespan,
- x_{ij} assignment variable
- t_{ij} time necessary to process job j on machine i,

$$\min_{x_{ij},y} y$$
s.t. $\sum_{i=1}^{m} x_{ij} = 1, j = 1, ..., n,$

$$\sum_{j=1}^{n} x_{ij} t_{ij} \le y, i = 1, ..., m.$$
(19)

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Lot Sizing Problem Uncapacitated single item LSP

- x_t production at period t
- y_t on/off decision at period t
- s_t inventory at the end of period t ($s_0 \ge 0$ fixed)
- D_t (predicted) expected demand at period t
- p_t unit production costs at period t
- f_t setup cost at period t
- *h_t* inventory cost at period *t*
- M large constant

$$\min_{\substack{x_t, y_t, s_t \\ t = 1}} \sum_{t=1}^{T} (p_t x_t + f_t y_t + h_t s_t)$$
