Birkhoff's theorem

A locally finite variety \mathcal{V} is finitely based iff $\mathcal{V} = \mathcal{V}^k$ for some k.

Birkhoff's theorem

A locally finite variety \mathcal{V} is finitely based iff $\mathcal{V} = \mathcal{V}^k$ for some k.

Figuring out the three-variable equations (2-semilattices plus one):

 $\begin{aligned} xx &\approx x\\ xy &\approx yx\\ x(xy) &\approx xy \end{aligned}$

Birkhoff's theorem

A locally finite variety \mathcal{V} is finitely based iff $\mathcal{V} = \mathcal{V}^k$ for some k.

Figuring out the three-variable equations (2-semilattices plus one):

 $\begin{aligned} xx &\approx x\\ xy &\approx yx\\ x(xy) &\approx xy \end{aligned}$

and

 $x(yz)\approx [(xy)(yz)][(xz)(yz)]$

Birkhoff's theorem

A locally finite variety \mathcal{V} is finitely based iff $\mathcal{V} = \mathcal{V}^k$ for some k.

Figuring out the three-variable equations (2-semilattices plus one):

 $\begin{aligned} xx &\approx x\\ xy &\approx yx\\ x(xy) &\approx xy \end{aligned}$

and

$$x(yz) \approx [(xy)(yz)][(xz)(yz)]$$

and a quasiequation

$$xy \approx xz \approx x \to x(yz) \approx x$$

Birkhoff's theorem

A locally finite variety \mathcal{V} is finitely based iff $\mathcal{V} = \mathcal{V}^k$ for some k.

Figuring out the three-variable equations (2-semilattices plus one):

 $\begin{aligned} xx &\approx x\\ xy &\approx yx\\ x(xy) &\approx xy \end{aligned}$

and

 $x(yz)\approx [(xy)(yz)][(xz)(yz)]$

Bulatov and Jeavons proved CSP dichotomy for tournaments in an early demonstration of the power of algebraic method for CSP.

Bulatov and Jeavons proved CSP dichotomy for tournaments in an early demonstration of the power of algebraic method for CSP.

This got generalized in two directions:

Bulatov and Jeavons proved CSP dichotomy for tournaments in an early demonstration of the power of algebraic method for CSP.

This got generalized in two directions:

Bulatov's theorem

2-semilattices have a finite relational width.

Bulatov and Jeavons proved CSP dichotomy for tournaments in an early demonstration of the power of algebraic method for CSP.

This got generalized in two directions:

Bulatov's theorem

2-semilattices have a finite relational width.

This is the nicest bounded width proof (as NU is too easy and special) and a template for many other which followed (CD(3) and CD(4), for example), till Barto and Kozik had to invent a lot of completely new ideas to tackle the general case.
