## Free-cut elimination

Jiří Rýdl

December 16, 2022

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

## Intro

- we will prove that the cut-elimination theorem applies in a special form to the case when we use extra non-logical axioms from some set &
- $\bullet \ \mathfrak{G}$  is assumed to be closed under substitution
- in general, cuts on formulas that have direct ancestors in some non-logical initial sequent cannot be removed, but other cuts can

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

### Free cuts

#### Definition

- a formula in an *LK*<sub>𝔅</sub>-proof is *anchored* if it is a direct descendant of some formula in an initial 𝔅-sequent
- a cut inference on φ is anchored if φ is atomic and both its occurrences in the premises are anchored, or φ is not atomic and at least one of its occurrences in the premises is anchored

- a cut inference is *free* if it is not anchored
- P is free-cut free if it contains no free cuts

## The procedure

- we use induction on the maximum depth of free cuts in an *LK*<sup>®</sup>-proof *P* - we have to ensure that anchored cuts do not change into free cuts during the procedure
- hence we have to assume that no cut-formula in P is only weakly introduced, i.e. at least one direct ancestor of every cut-formula is in an initial sequent or it is a principal formula of a strong inference

• if A is only weakly introduced in the right premise of the following cut inference

$$\frac{\Gamma \to \Delta, A \qquad A, \Gamma \to \Delta}{\Gamma \to \Delta}$$

then, to eliminate this cut, it makes sense to delete all direct ancestors of A in the right sub-proof

- but if a formula B ∈ Γ is anchored in the left premise but not anchored in right premise, the same B becomes only weakly introduced in the resulting proof
- specifically, it becomes unanchored, and if it is later used as a cut-formula, the respective cut inference now becomes free

### Theorem (Free-cut elimination)

Let & be a set of sequents closed under substitution.

- If  $LK_{\mathfrak{G}} \vdash \Gamma \rightarrow \Delta$ , then there is a free-cut free  $LK_{\mathfrak{G}}$ -proof of  $\Gamma \rightarrow \Delta$
- 2 Let P be an LK<sub>☉</sub>-proof such that no cut-formula is only weakly introduced in P. Assume further that every free cut in P has depth less than or equal to d. Then there is a free-cut free proof P\* of the same endsequent such that

$$\|P^*\| \le 2_{2d+2}^{\|P\|}$$

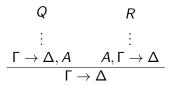

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

#### Lemma

Let P be an  $LK_{\mathfrak{G}}$ -proof ending with a free cut of the highest depth d among other free cuts in P. Then there is an  $LK_{\mathfrak{G}}$ -proof P<sup>\*</sup> of the same endsequent such that every free cut in P<sup>\*</sup> has depth strictly less than d and with  $||P^*|| < ||P||^2$ .

Furthermore, every formula occurring in the endsequent of P which was anchored by an  $\mathfrak{G}$ -sequent remains anchored in  $P^*$ , and every formula in the endsequent of  $P^*$  which is only weakly introduced was already only weakly introduced in P.

Suppose P ends with a topmost maximal-depth free cut

We distinguish cases according whether A is atomic or not, and if not, what is its outermost connective,  $\land, \lor$  or  $\supset$ . For the other connectives,  $\neg, \exists$  or  $\forall$  the standard argument works.

- assume w.l.o.g. that A is not anchored in R
- since A is not only weakly introduced, it has a direct ancestor in a logical initial sequent  $A \rightarrow A$
- replace every sequent  $\Pi \to \Lambda$  in R by  $\Pi^-, \Gamma \to \Delta, \Lambda$ , where  $\Pi^-$  is  $\Pi$  minus all direct ancestors of A
- all inferences remain valid, but the leaves may no longer be initial sequents: those initial sequents containing a direct ancestor of A now become Γ → Δ, A
- $\bullet$  since this sequent is provable by Q, replace all its occurrences by the sub-proof Q

# Proof - A is $B \vee C$

- if the sequent Γ → Δ, B ∨ C is derivable by Q, the sequent Γ → Δ, B, C is also derivable by a non-greater proof Q\* (same argument as in the standard cut elimination)
- form R' from R by replacing every sequent  $\Pi \to \Lambda$  in R with  $\Pi^-, \Gamma \to \Delta, \Lambda$  by deleting all direct ancestors of A and adding  $\Gamma$  and  $\Delta$  to the respective cedents
- *R'* is an invalid proof, every L∨ inference from *R* with *B* ∨ *C* principal becomes

$$\frac{B, \Pi^{-}, \Gamma \to \Delta, \Lambda}{\Pi^{-}, \Gamma \to \Delta, \Lambda} \frac{C, \Pi^{-}, \Gamma \to \Delta, \Lambda}{$$

# Proof - A is $B \lor C$ (cont.)

but we can combine the valid sub-proofs of the premises of R' with Q\*[Π<sup>-</sup>, Λ] to obtain a valid proof of the sequent Π<sup>-</sup>, Γ → Δ, Λ by the following transformation

- we thus fix R' and obtain a valid proof R\* of Γ, Γ → Δ, Δ, so the result follows by a series of contraction applications
- this transformation is done at every L∨ inference from R with C ∨ D principal, and so we get

$$\|P^*\| \le \|R\| imes (\|Q\| + 1) < \|P\|^2$$

## Proof - A is $B \rightarrow C$

- use a proof Q\* of B, Γ → Δ, C with ||Q\*|| ≤ ||Q|| and form R' from R by adding Γ, Δ to the respective cedents of all sequents in R and deleting all direct ancestors of A
- replace every incorrect  $L \rightarrow$  inference I in R of the form

$$\frac{\Pi^{-},\Gamma\to\Delta,\Lambda,B\quad C,\Pi^{-},\Gamma\to\Delta,\Lambda}{\Pi^{-},\Gamma\to\Delta,\Lambda}$$

by the combination of  $Q^*[\Pi^-, \Lambda]$  and the valid sub-proofs of *I*:

$$\frac{\overline{\Pi^{-},\Gamma \to \Delta,\Lambda,B} \quad B,\overline{\Pi^{-},\Gamma \to \Delta,\Lambda,C}}{\overline{\Pi^{-},\Gamma \to \Delta,\Lambda,C}} \quad C,\overline{\Pi^{-},\Gamma \to \Delta,\Lambda}$$

## What was different from the proof for *LK*?

- the overall structure of the algorithm is the same, double induction on the (depth, height) of the *free* cuts in *P*
- but now we do not discard entire sub-proofs when we 'fix' invalid binary inferences during the procedure
- this way anchored formulas in the endsequents remain anchored during the transformations and the same holds for those formulas that were not only weakly introduced

#### e.g.

In the proof for LK in the  $\lor$ -case Buss forms two intermediate trees  $R_1$  and  $R_2$  from R whose fixing requires the deletion of entire sub-proofs, while in the proof for  $LK_{\mathfrak{G}}$  he forms an intermediate tree R' which is then locally 'repaired' from the top to the bottom in such a way that no sub-proofs are deleted.

# Induction

- we want to formalize induction in the sequent calculus so that we can apply the free-cut elimination theorem to theories where induction is restricted to certain classes of formulas
- we use induction rules instead of induction axioms:

$$rac{A(b), \Gamma 
ightarrow \Delta, A(b+1)}{A(0), \Gamma 
ightarrow \Delta, A(t)}$$

The variable b works as an eigenvariable, t is an arbitrary term.

- Robinson's arithmetic Q (basic properties of the successor function, addition and multiplication) together with induction for  $\Sigma_n$  formulas form a theory called  $I\Sigma_n$
- in the sequent calculus, Q is formalized as additional initial sequents and for  $I\Sigma_n$  the induction rule above is restricted to  $\Sigma_n$  formulas
- another important theories (to which we will probably get next semester) are fragments of bounded arithmetic  $T_2^n$  and  $S_2^n$

# Extending some definitions

#### Notation

If  $\Phi$  is a set of formulas,  $\mathcal{T}+\Phi\text{-IND}$  denotes a theory  $\mathcal{T}$  together with the above induction rules restricted to  $\Phi$ 

### Definition

- for a sequent calculus proof P in an arithmetic theory

   Φ + Φ-IND take the *principal formulas* of an induction inference to be A(0) and A(t)
- an occurrence of a formula in *P* is *anchored* if it is a direct descendent of a formula in an initial sequent from  $\mathfrak{G}$  or a direct descendent of a principal formula of an induction inference.
- the notions of an anchored and a free cut are defined as above

#### Theorem (Free-cut elimination for theories with induction)

If T is some theory of arithmetic  $\mathfrak{G} + \Phi$ -IND with  $\mathfrak{G}$  and  $\Phi$  closed under term substitution and if  $\Gamma \to \Delta$  follows from T, then there is a free-cut free T-proof of  $\Gamma \to \Delta$ . Moreover, the previous upper bounds also apply here.

#### Corollary

If T and  $\mathfrak{G}$  are as before,  $\Phi$  is closed under term substitution and under subformulas,  $\mathfrak{G}$ -sequents only contain formulas from  $\Phi$ ,  $\Gamma \to \Delta$  is a logical consequence of T and every formula in  $\Gamma \to \Delta$ is in  $\Phi$ , then there is a T-proof P of  $\Gamma \to \Delta$  such that every formula in P is in  $\Phi$ .
