Theorem (Canonical model theorem)

Let L contain at least one constant and let T be an =-closed L-theory which contains only atomic sentences, then there exists a structure A such that:

- $\forall a \in A \exists t \ a \ closed \ L$ -term : $a = t^{\mathcal{A}}$
- $\forall \phi$ an atomic L-sentence : $\mathcal{A} \models \phi \iff \phi \in \mathcal{T}$

Proof (sketch cont.)

 Uniqueness: Notice, that for every B ⊨ T, there is a unique homomorphism f: A → B sending t_~ → t^B, this follows just from the two requirements we have one A.

Theorem (Canonical model theorem)

Let L contain at least one constant and let T be an =-closed L-theory which contains only atomic sentences, then there exists a structure A such that:

- $\forall a \in A \exists t \ a \ closed \ L$ -term : $a = t^{\mathcal{A}}$
- $\forall \phi$ an atomic L-sentence : $\mathcal{A} \models \phi \iff \phi \in \mathcal{T}$

Proof (sketch cont.)

- Uniqueness: Notice, that for every B ⊨ T, there is a unique homomorphism f: A → B sending t_~ → t^B, this follows just from the two requirements we have one A.
- So if A' were satisfy the statement of the theorem we would have g: A → A' and h: A' → A, so h ∘ g: A → A but only such homomorphism is the identity.

Notions of consistency

• We would like to formalize sufficient condition for a theory to have a model.

Notions of consistency

- We would like to formalize sufficient condition for a theory to have a model.
- We can do so without proof calculus using the following notion.

Notions of consistency

- We would like to formalize sufficient condition for a theory to have a model.
- We can do so without proof calculus using the following notion.
- You can think of it like this: What are the conditions for some theory such that the theory "could be true in some structure"?

Definition (Notion of consistency)

Let L be a first-order language of cardinality λ . We shall call a set of sets of L-sentences N a **notion of consistency** if the following conditions hold for every set $p \in N$:

• Intuitively having a notion of consistency mean that we can unpack sentences in a theory into atomic sentences.

э

Remarks

- Intuitively having a notion of consistency mean that we can unpack sentences in a theory into atomic sentences.
- Notice that for some consistent theories we don't necessarily have a way to construct a notion of consistency, since the language L may not have enough terms, we can however always enrich the language. (As in the proof of the completeness theorem.)

Remarks

- Notice that for some consistent theories we don't necessarily have a way to construct a notion of consistency, since the language L may not have enough terms, we can however always enrich the language. (As in the proof of the completeness theorem.)
- Elements $p \in N$ are called **conditions**.

Theorem

If N is a notion of consistency and $p \in N$, then p has a model.

э

(4) (日本)

Theorem

If N is a notion of consistency and $p \in N$, then p has a model.

Proof

Let $p_0 := p$. We will construct a λ -long ascending chain of conditions $(p_i)_{i < \lambda}$ using the properties of N. At each step we will only add finitely many new sentences so by (13) we have that $\bigcup \overline{p} := \bigcup_{i < \lambda} p_i \in N$.

Theorem (Compactness)

Let L be a language of cardinality λ . Let T be finitely satisfiable L-theory. Then T is satisfiable.

э

→ < ∃ →</p>

Theorem (Compactness)

Let L be a language of cardinality λ . Let T be finitely satisfiable L-theory. Then T is satisfiable.

Proof

Let $W := \{c_i; i < \lambda\}$ be a set of new constants. And let N be a set of sets of L(W)-sentences such that

 $p \in N$ (i) Fewer than λ constants from W occur in sentences of p and (ii) p is finitely satisfiable.

Theorem (Compactness)

Let L be a language of cardinality λ . Let T be finitely satisfiable L-theory. Then T is satisfiable.

Proof

Let $W := \{c_i; i < \lambda\}$ be a set of new constants. And let N be a set of sets of L(W)-sentences such that

 $p \in N$ (i) Fewer than λ constants from W occur in sentences of p and (ii) p is finitely satisfiable.

Theorem (Compactness)

Let L be a language of cardinality λ . Let T be finitely satisfiable L-theory. Then T is satisfiable.

Proof

Let $W := \{c_i; i < \lambda\}$ be a set of new constants. And let N be a set of sets of L(W)-sentences such that

$$p \in N$$

 (i) Fewer than λ constants from W occur in sentences of p and
 (ii) p is finitely satisfiable.

Notice that $T \in N$ since it contains no constant from W and is finitely satisfiable.
Compactness theorem

Theorem (Compactness)

Let L be a language of cardinality λ . Let T be finitely satisfiable L-theory. Then T is satisfiable.

Proof

Let $W := \{c_i; i < \lambda\}$ be a set of new constants. And let N be a set of sets of L(W)-sentences such that

$$p \in N$$

 (i) Fewer than λ constants from W occur in sentences of p and
 (ii) p is finitely satisfiable.

Notice that $T \in N$ since it contains no constant from W and is finitely satisfiable. It is easy to verify that N is a notion of consistency for L(W) which by previous theorem implies that T is satisfiable!

• Recall the theorem about satisfiability of conditions of notion of consistency.

- Now image that each task τ belongs to some model theorist τ^* .
- Every model theorist τ^* can think of himself as playing a game against all other model theorists:

- Recall the theorem about satisfiability of conditions of notion of consistency.
- There were λ tasks to be performed in construction of $(p_i)_{i < \lambda}$ and each of the tasks could be completed, provided that λ many sets p_{i+1} were assigned to it.
- Now image that each task τ belongs to some model theorist τ^* .
- Every model theorist τ* can think of himself as playing a game against all other model theorists: he wins the game is the task τ has been completed by the time the chain (p_i)_{i<λ} is finished.
- Then each model theorist has a winning strategy of his own game, provided that he can pick λ of the sets p_{i+1} .

- A position y
 is called winning for a player if that player has a winning strategy from y
 onwards.

Ondřej Ježil

Theorem

Let \overline{y} is a position in a game G before the play has been finished. Then:

э

Theorem

Let \overline{y} is a position in a game G before the play has been finished. Then:

• If \overline{y} is winning for a player, then the player can guarantee to be still in a winning position after the next move.

Theorem

Let \overline{y} is a position in a game G before the play has been finished. Then:

- If \overline{y} is winning for a player, then the player can guarantee to be still in a winning position after the next move.
- If \overline{y} is not winning for a player, then the other player can guarantee that the former player is still not in the winning position after the next move.

Theorem

Let \overline{y} is a position in a game G before the play has been finished. Then:

- If \overline{y} is winning for a player, then the player can guarantee to be still in a winning position after the next move.
- If \overline{y} is not winning for a player, then the other player can guarantee that the former player is still not in the winning position after the next move.

Theorem

Let \overline{y} is a position in a game G before the play has been finished. Then:

- If \overline{y} is winning for a player, then the player can guarantee to be still in a winning position after the next move.
- If \overline{y} is not winning for a player, then the other player can guarantee that the former player is still not in the winning position after the next move.

This implies that games of finite length are determined!

Forcing with games (a teaser)
