Integrace racionálních fci
 aneb Rozklad na parciální zlomky

Integrujeme fci $\frac{p(x)}{q(x)}$, $p, q = \text{polynomy}$

1) pokud stupeň $p \geq$ stupeň q , částečně vydělíme \rightarrow získáme
 polynom + $\frac{\tilde{p}(x)}{q(x)}$, kde stupeň $\tilde{p} <$ stupeň q

2) předp. st. $p <$ st. q , p, q normované (\Leftrightarrow ved. koef. = 1),
 pak q rozložíme na součin $(x-a_i)^{k_i} \cdot \underbrace{(x^2+b_jx+c_j)^{l_j}}_{\text{nerozložit.}}$

③ Pak lze vždy psát:

a) pokud $\forall k_i = 1, \forall l_j = 1$:

$$\frac{p(x)}{(x-a_1) \dots (x-a_m) \cdot (x^2+b_1x+c_1) \dots (x^2+b_nx+c_n)} =$$

$$= \frac{A_1}{x-a_1} + \dots + \frac{A_m}{x-a_m} + \frac{B_1x+C_1}{x^2+b_1x+c_1} + \dots + \frac{B_nx+C_n}{x^2+b_nx+c_n}$$

pro nějaká čísla $A_i, B_j, C_j \in \mathbb{R}$

b) pro členy s vyšší mocninou:

$$(x-a_1)^{k_1} \Rightarrow \frac{A_1^1}{(x-a_1)} + \frac{A_1^2}{(x-a_1)^2} + \dots + \frac{A_1^{k_1}}{(x-a_1)^{k_1}}$$

$$(x^2+b_1x+c_1)^{l_1} \Rightarrow \frac{B_1^1x+C_1^1}{(\quad)^1} + \frac{B_1^2x+C_1^2}{(\quad)^2} + \dots + \frac{B_1^{l_1}x+C_1^{l_1}}{(\quad)^{l_1}}$$

④ Přitom tato čísla A_i, B_j, C_j lze určit 2 způsoby:

a) univerzální způsob: výraz upravo převedu na spol. jmenov.,
čitatele rozmažoluším a porovnám koeficienty s $p(x) \rightarrow$ soustava rovnic

$$\underline{\text{Pr:}} \quad \frac{x+3}{x^2-3x+2} = \frac{x+3}{(x-1) \cdot (x-2)} = \frac{A}{x-1} + \frac{B}{x-2} = \frac{A(x-2) + B(x-1)}{(x-1)(x-2)}$$

$$\text{čítatel } (A+B)x - 2A - B = x + 3$$

$$\begin{array}{l} \text{porovnám} \\ \text{koeficienty:} \end{array} \quad \begin{array}{l} x: A+B=1 \\ 1: \underline{-2A-B=3} \end{array} \quad \begin{array}{l} \text{řeším } A=-4 \\ B=5 \end{array} \Rightarrow \frac{-4}{x-1} + \frac{5}{x-2}$$

b) ~~zakrytá~~ zakryvací metoda: pro výpočet A zakryjím $(x-1)$
v prvn. zlomku a do zbytku dosadím kořen 1: $A = \frac{1+3}{1-2} = \frac{4}{-1} = \underline{\underline{-4}}$

$$B = \frac{2+3}{2-1} = \frac{5}{1} = \underline{\underline{5}}$$

hodí jen pro lin. členy v 1. mocnině.

Někdy je vhodné obě metody kombinovat.

⑤ integrace vzniklých členů:

$$\int \frac{dx}{x-a} = \ln|x-a|$$

$$\int \frac{dx}{(x-a)^k} = \frac{1}{1-k} \frac{1}{(x-a)^{k-1}}$$

$$\int \frac{Bx+C}{x^2+bx+c} dx = \int \frac{B}{2} \cdot \frac{2x+b}{x^2+bx+c} dx + \underbrace{\int \frac{C - \frac{Bb}{2}}{x^2+bx+c} dx}_{\text{viz dále}}$$
$$= \frac{B}{2} \ln(x^2+bx+c)$$

$$= \left[\begin{array}{l} y = \frac{2x-1}{\sqrt{7}} \\ dy = \frac{2}{\sqrt{7}} dx \end{array} : \frac{2}{\sqrt{7}} \int \frac{dy}{y^2+1} = \frac{2}{\sqrt{7}} \operatorname{arctg} y \right] = \underline{\underline{\frac{2}{\sqrt{7}} \operatorname{arctg} \left(\frac{2x-1}{\sqrt{7}} \right)}}$$

Pr. 5: $\int \frac{4x^2}{x^4-1} dx : \frac{4x^2}{x^4-1} = \frac{4x^2}{(x-1)(x+1)(x^2+1)} = \frac{A}{x-1} + \frac{B}{x+1} + \frac{Cx+D}{x^2+1}$
