Příklad Řešení vlnové rovnice na kouli (v $\mathbb{R}^3$)

Řešení $u(t,x_1,x_2,x_3)$ rovnice $\frac{\partial^2 u}{\partial t^2} - k^2 \Delta u = 0$ hledejme ve tvaru $u(t,x) = v(t,|x|)$.

Pak $\frac{\partial u}{\partial x_i} = \frac{\partial v}{\partial r}\frac{x_i}{|x|}$ a $\frac{\partial^2 u}{\partial x_i^2} = \frac{\partial^2 v}{\partial r^2}\frac{x_i}{|x|}\frac{x_i}{|x|} + \frac{\partial v}{\partial r}\left(\frac{1}{|x|} - \frac{x_i x_i}{|x|^3}\right)$

Tedy $\Delta u = \frac{\partial^2 v}{\partial r^2} + \frac{2}{r}\frac{\partial v}{\partial r} = \frac{1}{r}\frac{\partial^2}{\partial r^2}(rv)$, kde $v = v(t,r)$, $r \in (0,R)$

Řešení $\Box u = 0$ v $(0,+\infty)\times B_R(0)$ jsme

$$\begin{cases} u(0,x) = 0, \quad \frac{\partial u}{\partial t}(0,x) = 1 & \text{v } B_R(0) \\ u(t,x) = 0 & \text{na } (0,+\infty)\times \partial B_R(0) \end{cases}$$

jsme redukovali na úlohu

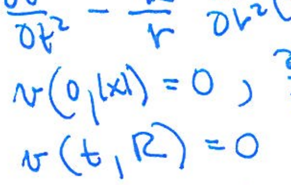
$$\begin{cases} \frac{\partial^2 v}{\partial t^2} - \frac{k^2}{r}\frac{\partial^2}{\partial r^2}(rv) = 0 & \text{v } (0,+\infty)\times(0,R) \\ v(0,|x|) = 0, \quad \frac{\partial v}{\partial t}(0,\cdot) = 1 & \text{v } (0,R) \\ v(t,R) = 0 & \text{v } (0,+\infty) \end{cases}$$

Vynásobíme-li rovnici r a označme $w(t,r) := rv(t,r)$, pak pro w máme

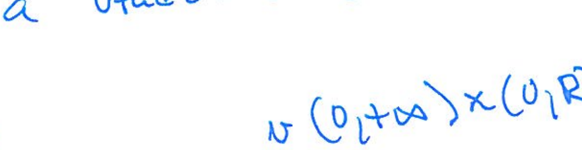
$$\begin{cases} \frac{\partial^2 w}{\partial t^2} - k^2\frac{\partial^2 w}{\partial r^2} = 0 & \text{v } (0,+\infty)\times(0,R) \\ w(0,r) = 0, \quad \frac{\partial w}{\partial t}(0,r) = r & \text{v } (0,R) \\ w(t,0) = w(t,R) = 0 & \text{v } (0,+\infty) \end{cases}$$

Tuto úlohu vyřešíme metodou periodizace: pro jednoduchost $R = \frac{1}{2}$. Pak liché prodloužení:

$\tilde{w}_p$:



konvolucí s $\delta_{\mathbb{Z}}$ dostáváme:



a

$$\tilde{w} = \sum_{n\in\mathbb{Z}} \frac{\sin 2\pi k|m|t}{2\pi k|m|} c_m e^{2\pi i m r}, \quad \text{kde } c_m = \langle \tilde{w}_p, e^{-2\pi i m r}\rangle = \int_{-1/2}^{1/2} \tilde{w}_p e^{-2\pi i m r}\,dr$$

Cv5/2

Tedy $c_n = \int_{-1/2}^{1/2} r e^{-2\pi i n r}\, dr = \int_{-1/2}^{1/2} \underbrace{\underset{\text{lichá}}{r}\,(\underset{\text{sudé}}{\cos 2\pi nr}}_{=0} - i\underset{\text{liché}}{\sin 2\pi nr})\, dr =$

$= -2i \int_0^{1/2} \underset{1}{r}\, \underset{-\frac{\cos 2\pi nr}{2\pi n}}{\sin 2\pi nr}\, dr$

per partes

$= 2i \left[r \frac{\cos 2\pi nr}{2\pi n} \right]_0^{1/2} + 2i \int_0^{1/2} \frac{\cos 2\pi nr}{2\pi n}\, dr$

$= + \frac{(-1)^n i}{2\pi n} + 2i \left[\frac{\sin 2\pi nr}{(2\pi n)^2} \right]_0^{1/2} = \frac{(-1)^{n+1}}{2\pi n} i$

Tedy ($c_0 = 0$)

$$\underbrace{\tilde{w}(t,r) = \sum_{n\in\mathbb{Z}} \underbrace{\frac{\sin 2\pi k|n|t}{2\pi k|n|}}_{\text{sudé v } n} \underset{\text{liché v } n}{\frac{(-1)^n}{2\pi n}}\, i\,(\underset{\text{sudé}}{\cos 2\pi nr} + i \underset{\text{liché}}{\sin 2\pi nr})}$$

$$= \sum_{n=1}^{\infty} \frac{\sin 2\pi k|n|t}{2\pi k|n|} \frac{(-1)^{n+1}}{\pi n} \sin 2\pi nr$$

$$\Rightarrow \boxed{v(t,r) = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{\sin 2\pi k n t}{2\pi^2 k n^2}\, r \sin 2\pi n r}$$
