

25. Vedeu' tebe v dimenzi 0.

$$\dot{y}(t) = a(g(t) - y)$$

$y(t)$ -- tebe "bodu"

$g(t)$ -- tebe drži

a -- tebe rigne

Laplace: $Y = \mathcal{L}[y]$

$$G = \mathcal{L}[g]$$

$$pY - y(0) = aG - aY$$

$$Y = \frac{y(0)}{a+p} + \frac{a}{a+p} G; \quad \mathcal{L}[e^{-at}] = \frac{1}{a+p}$$

$$y(t) = y(0)e^{-at} + ae^{-at} * g$$

$$= \underbrace{y(0)e^{-at}}_{\rightarrow 0} + \underbrace{\int_0^t ae^{-as} g(t-s) ds}_{\rightarrow g(t)}; \quad a \rightarrow \infty$$

metoda: $ae^{-as} \rightarrow \delta_0$ (shlovenje funkcije)

Pozn.: jinj argument:

$$\frac{a}{a+p} \rightarrow 1 = \mathcal{L}[\delta_0]$$

$$y: ae^{-as} \rightarrow \delta_0.$$

e^{-s}
 ae^{-as}
